A: This is an old thread, but I finally found the easiest way to get this up and running. From the ePSXe website: Many Users and Developers of this wonderful software previously use the old ePSXe bios on the old version on their computers. To find out, head over to this ePSXe forum thread for the most recent versions: ePSXe 2.0.5 Official Bios Database. Q: Switching between VMs on Amazon AWS I wanted to run a bunch of VMs

on EC2, say 10. I wanted to easily switch between these VMs. So I created them all. But what I found is that when I switch to them, they are not there (as if they are on a single machine). So, I find that creating the VMs is really a waste of money. Is there a way to make all my VMs on the same machine? I mean all these VMs are on one machine. Is it possible? Or are there any ways to easily manage these VMs

from one central machine? A: There is no way you can have your 10 machines in a single EC2 instance, that's why they are called EC2 instances. In your situation, you just don't need to do that. What you can do is give each machine a static IP address, a unique hostname (only one in the same subnet) and assign them a different default gateway. For that, you'll have to modify your EC2 instance and use an external routing table. However, when

you turn on the new instance, it will be configured with the same routing table that you configured previously. The problem is that you have to create a routing table for your VMs, and you can't do that manually. In that case, you'll have to follow Amazon's documentation on that matter. A: Note that on ECS you can assign each task to the same machine. If you want to do it differently, there's probably a better way. You can also use ebs (EBS-

optimized instances). These are described in the aws instances manual. Q: Why is my ping request so far from the server? I am trying to send a ping request from my Ubuntu VM to a server that uses the SSH port. The issue is, when 1cb139a0ed
