The **New Features**, Global Adjustment, and Hue/Saturation menus are new to the 2013 release. The **New Features** menu gives you a variety of a new ways to make your photos look better. Global Adjustment opens a new window with more than 50 additional editing tools that you can use on all of your images. The lighting and color adjustments tools performed so amazingly well that I almost can't believe how powerful they are. Layers, masks, and even smart object revisions of exposures used in Lightroom are present in Photoshop, too, and these enhancements have, of course, allowed photoshop to be more a part of my workflow than ever before. Photoshop was developed for a single purpose: to create high-quality images, consistently, with a lot of flexibility. So you might be justified in being skeptical that it could possibly be made to work with your workflow workflow, but, amazingly, it can be. It's a piece of software that has been elegantly designed from the ground up to operate like a large database. A toolbox in the background that allows you to make just about any adjustment you want, as long as you understand how to work the interface. Handwriting is just one of the many tools that you can use in Photoshop. All of your tools can be mixed and matched through the interface and you can experiment with them on your own images without affecting your main copy. The mission of Adobe Photoshop CC isn't to provide a fairly robust toolbox that allows professional photographers to create any kind of photo they can think of, but more so to provide a way to work everyday shots into the studio and create big project pieces. If you need to edit out a girl from the sunset on a great picture you've shot with a prized camera, then you're about as far from the professional as you can get.
