In Lightroom 5, Adobe has introduced the ability to save titles to the images. Thus, it has become easier for the clients to refer to the series of particular images when necessary. Also, customers can budget for images more easily when they have to save expensive professional images. It is possible to cover a particular set of prints with one price, much like a magazine. Lightroom 5 has introduced a few new features that I enjoyed when using the program. First is that textures are now much easier to apply and manipulate. The onslaught of ways to use textures is what makes Lightroom great, and now it's all gotten a bit better. Users can now make more realistic interpretations of textures in a series of images by using the Adjustment Brush. Creating custom titles is now easier as well with the single click of a button. Only the basic work is that you have to create some type of sequences, name them, and then you can organize them by creating smart collections. One of the coolest features of Lightroom is the ability to edit key points on photos. This allows for shading, cropping, and adding a focal point to the image, as well as a wide range of other effects. It's all quite easy to do. These are not all the new features, but are some of the new features that were announced at the Adobe MAX 2015 conference held on October 7, 2015. To me, of the 70 features available, the ones that interest me most as an individual user tended to be more stable in the mix. In most cases, 8 out of 10 times, when I used the features, they worked as advertised. Here, I will list the most interesting new features:

One of the most powerful properties of shape layers is their ability to create masks. To lower its opacity, press Shift and click it. To increase its opacity, press Alt and click the layer to activate the opacity settings. Use Alt+Z to restore the default opacity setting of 100%. When you're finished, press Enter. Naturally, you can create as many shapes as you would like with other suggestions for shapes. Using the Brush tool, you can change a group of pixels in a specific area of a layer, or you can apply an effect to a full-color layer.
